Title: Creating VLAN and VLAN Trunking using Packet Tracer

Theory:

a. VLAN, VLAN Trunking & its Architecture

A VLAN (Virtual Local Area Network) is a network configuration that segments a single physical network into multiple logical networks. Each VLAN acts like an independent network, even though multiple VLANs may share the same physical network infrastructure. VLANs improve network security, reduce broadcast traffic, and allow network administrators to segment traffic logically based on factors like department or function within an organization.

VLAN Trunking:

VLAN trunking is a method used to allow traffic from multiple VLANs to traverse a single network link between switches or other network devices. This is achieved by tagging Ethernet frames with a VLAN identifier, commonly through IEEE 802.1Q tagging. Trunking enables the extension of VLANs across network devices, supporting greater flexibility in network design and allowing VLANs to span across different physical locations.

VLAN Architecture:

VLAN architecture is designed to logically group devices across different network segments, creating multiple broadcast domains on a single network infrastructure. Each VLAN typically corresponds to a different logical network, isolating traffic between VLANs unless explicitly allowed through routing or firewall rules. The architecture includes components like access ports (where devices are connected to the VLAN), trunk ports (which carry traffic for multiple VLANs), and VLAN-aware network devices that manage traffic across various segments. This modular design enhances scalability, security, and performance in modern networks.

b. Components Used

Hardware: Switches (2), Ethernet cables, End devices (4).

Software: Cisco Packet Tracer

c. Network Diagram

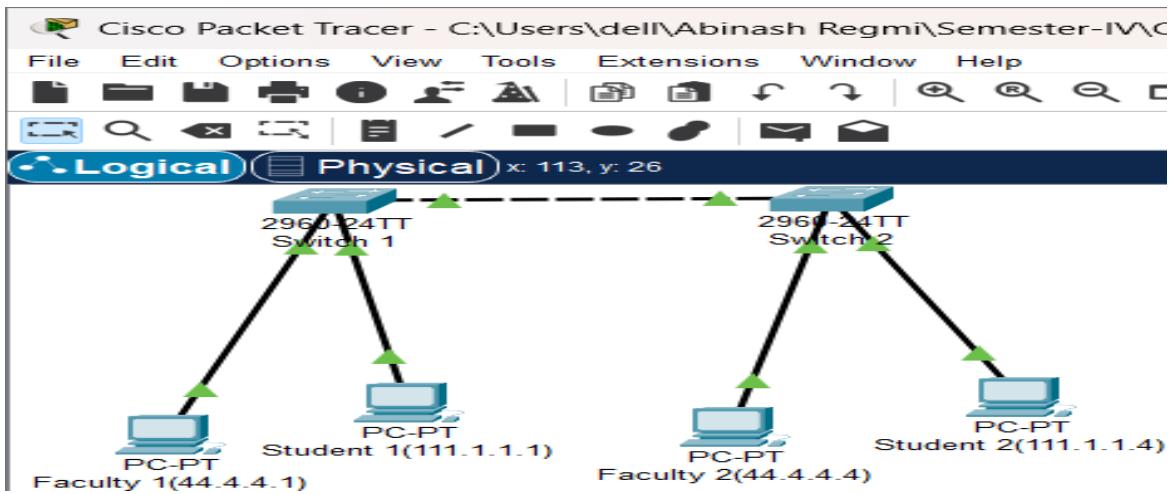

Fig: Network map for VLAN

Procedure

Here is the procedure for creating the LAN network shown in the image using Cisco Packet Tracer:

Step 1: Launch Cisco Packet Tracer

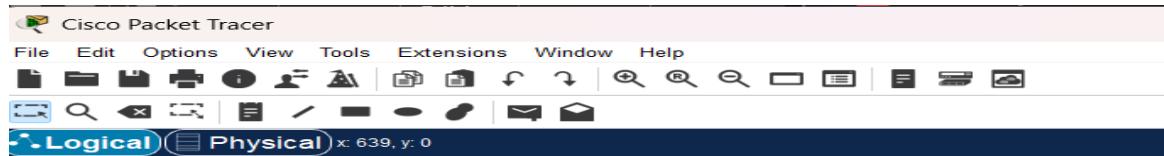

Fig: Workspace for network design

Step 2: Add the network devices to the workspace and connecting devices:

- 2.1 From the Device-Type Selection box, choose the following devices and add them to the workspace:
- 2.2 One 2690-24TT Switch and four PC's
- 2.3 Use the copper straight-through cable to connect each PC to one of the available ports on the switch.
- 2.4 Ensure that each connection is made properly.

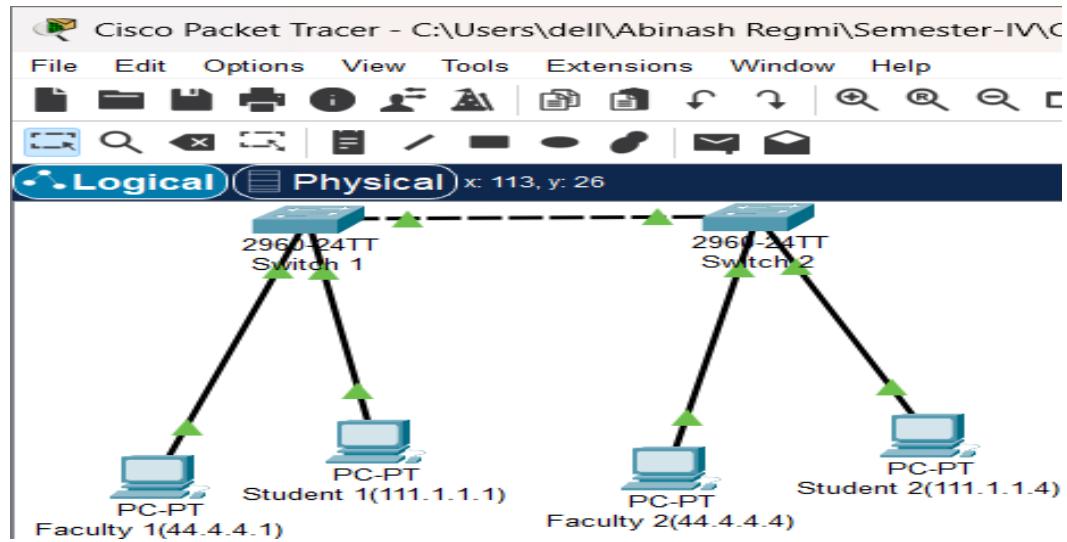

Fig: Connection between all devices in VLAN

Step 4: Configure IP addresses:

- 4.1 Right-click on each PC and select “IP Configuration”.
- 4.2 In the IP Configuration window, enter the IP address as 44.4.4.1 for port 1 and 111.1.1.1 for port 2 in switch 1 and 44.4.4.4 for port 1 and 111.1.1.4 for port 2 in switch 2, subnet mask, and default gateway for each PC.

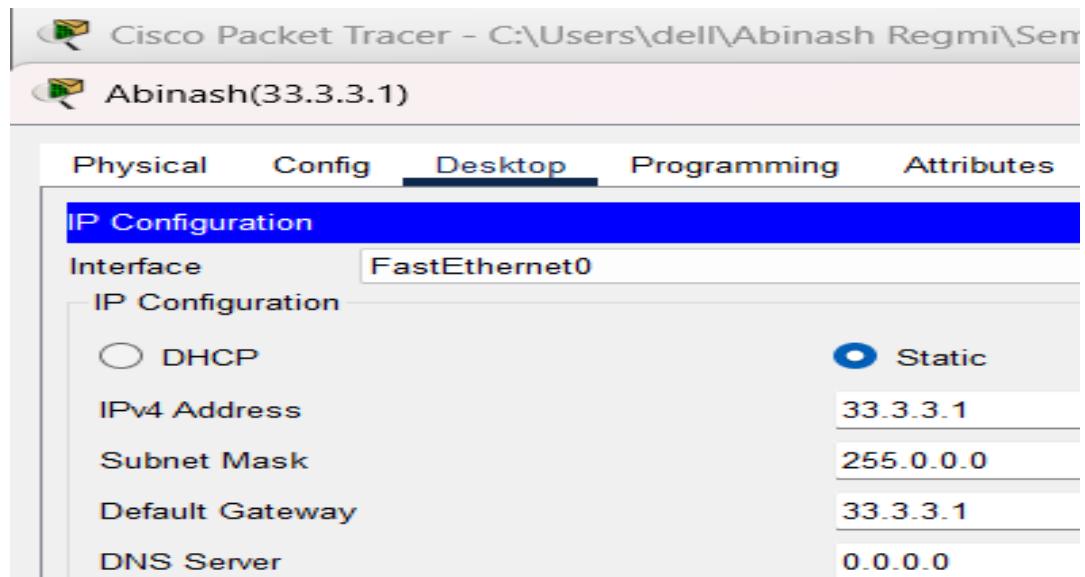

fig: IP configuration

Step 5: Configuring VLANs:

- 5.1 Create VLAN on both Switches & Assign Port to both switches.
- 5.2 Create truncation in the both switches

Code for VLAN configurations:

```
Switch(config)#vIan 10
```

```

Switch(config-vlan)#name student
Switch(config-vlan)#vlan 20
Switch(config-vlan)#name faculty
Switch(config-vlan)#exit
Switch(config)#exit

```

Code for Assigning ports:

```

Switch#config t
Switch(config)#int fac 0/3
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 10
Switch(config-if)#int fa 0/2
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 20
Switch(config-if)#exit
Switch(config)#exit

```

Code for Trunking Switches:

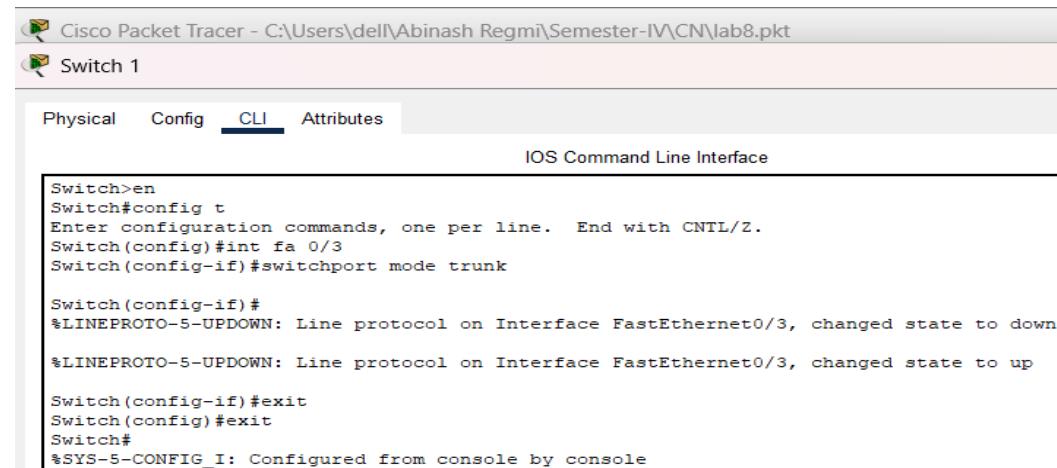

```

Switch#config t
Switch(config)#int fa 0/3
Switch(config-if)#switchport mode trunk
Switch(config-if)#exit
Switch(config)#exit

```

VLAN	Name	Status	Ports
1	default	active	Fa0/1, Fa0/2, Fa0/3, Fa0/4 Fa0/5, Fa0/6, Fa0/7, Fa0/8 Fa0/9, Fa0/10, Fa0/11, Fa0/12 Fa0/13, Fa0/14, Fa0/15, Fa0/16 Fa0/17, Fa0/18, Fa0/19, Fa0/20 Fa0/21, Fa0/22, Fa0/23, Fa0/24 Gig0/1, Gig0/2
10	faculty	active	
20	student	active	
1002	fddi-default	active	
1003	token-ring-default	active	
1004	fdдинet-default	active	
1005	trnet-default	active

Switch 1

Physical Config CLI Attributes
IOS Command Line Interface

Switch>en
Switch#config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#int fa 0/3
Switch(config-if)#switchport mode trunk

Switch(config-if)#
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/3, changed state to down
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/3, changed state to up

Switch(config-if)#exit
Switch(config)#exit
Switch#
%SYS-5-CONFIG_I: Configured from console by console

```

Fig: Configuring trunking between switches

Step 7: Verify connectivity

7.1 To test whether the network is working, you can ping other devices on the network from each PC.

7.2 To ping another device, open a command prompt on the PC and type “ping <IP address of the other device>”.

7.3 If the ping is successful, you should see replies from the other device.

Cisco Packet Tracer - C:\Users\dell\Abinash Regmi\Semester-IV\CN\

Student 1(111.1.1.1)

Physical Config Desktop Programming Attributes

Command Prompt

```
Cisco Packet Tracer PC Command Line 1.0
C:>ping 111.1.1.4

Pinging 111.1.1.4 with 32 bytes of data:

Reply from 111.1.1.4: bytes=32 time<1ms TTL=128

Ping statistics for 111.1.1.4:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

Cisco Packet Tracer - C:\Users\dell\Abinash Regmi\Semester-IV\CN\

Student 2(111.1.1.4)

Physical Config Desktop Programming Attributes

Command Prompt

```
Cisco Packet Tracer PC Command Line 1.0
C:>ping 111.1.1.1

Pinging 111.1.1.1 with 32 bytes of data:

Reply from 111.1.1.1: bytes=32 time<1ms TTL=128

Ping statistics for 111.1.1.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

Fig: Connectivity test between network student1(111.1.1.4) and (111.1.1.1)

Cisco Packet Tracer - C:\Users\dell\Abinash Regmi\Semester-IV\CN\

Student 1(111.1.1.1)

Physical Config Desktop Programming Attributes

Command Prompt

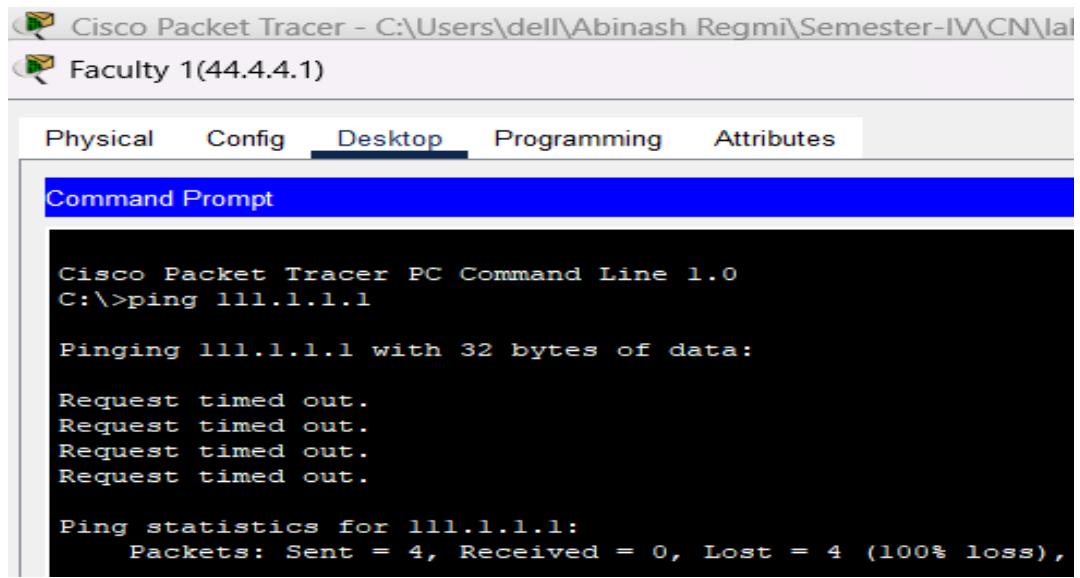

```
Cisco Packet Tracer PC Command Line 1.0
C:>ping 44.4.4.1

Pinging 44.4.4.1 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 44.4.4.1:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

Fig: Connectivity test between network student1(111.1.1.1) and faculty1(44.4.4.1)

The screenshot shows the Cisco Packet Tracer software interface. At the top, there are two tabs: 'Cisco Packet Tracer - C:\Users\dell\Abinash Regmi\Semester-IV\CN\lab' and 'Faculty 1(44.4.4.1)'. Below the tabs is a menu bar with five items: Physical, Config, Desktop, Programming, and Attributes. The 'Desktop' item is currently selected and underlined. A blue header bar labeled 'Command Prompt' is visible. The main window displays a command-line interface with the following text:
Cisco Packet Tracer PC Command Line 1.0
C:>ping 111.1.1.1
Pinging 111.1.1.1 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.
Ping statistics for 111.1.1.1:
Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

Fig: Connectivity test between network faculty1(44.4.4.1)) and student1(111.1.1.1)

Conclusion

In conclusion, creating VLANs and implementing VLAN trunking using Cisco Packet Tracer enhances network segmentation and management. By keeping devices into distinct VLANs, you effectively reduce broadcast domains, improve security, and optimize network performance. VLAN trunking, which facilitates the transmission of multiple VLANs across a single link, ensures efficient communication between VLANs across switches. This approach highlights the importance of structured network design in reducing broadcasting and simplifying network administration, ultimately contributing to scalability and efficiency of modern networks.
